

Two Track Cuts with miniDST

hbtMiniDst.C main cuts

```
// Create and set track cut for pion selection using TPC+TOF method

MpFemtoBasicTrackCut *trackCut = new MpFemtoBasicTrackCut();

trackCut->selectPrimary( true ); // analyse only primary tracks

trackCut->setCharge( 1 );

trackCut->setNHits( 15, 60 );

trackCut->setEta( -1., 1. );

trackCut->setPt( 0.15, 1.45 );

trackCut->setP( 0.15, 1.45 );

trackCut->setDCA( 0., 3. );

trackCut->setDetectorSelection( 2 );

trackCut->setTnTNSigmaPion( -2., 2. );

trackCut->setMassSqr( -0.05, 0.08 );

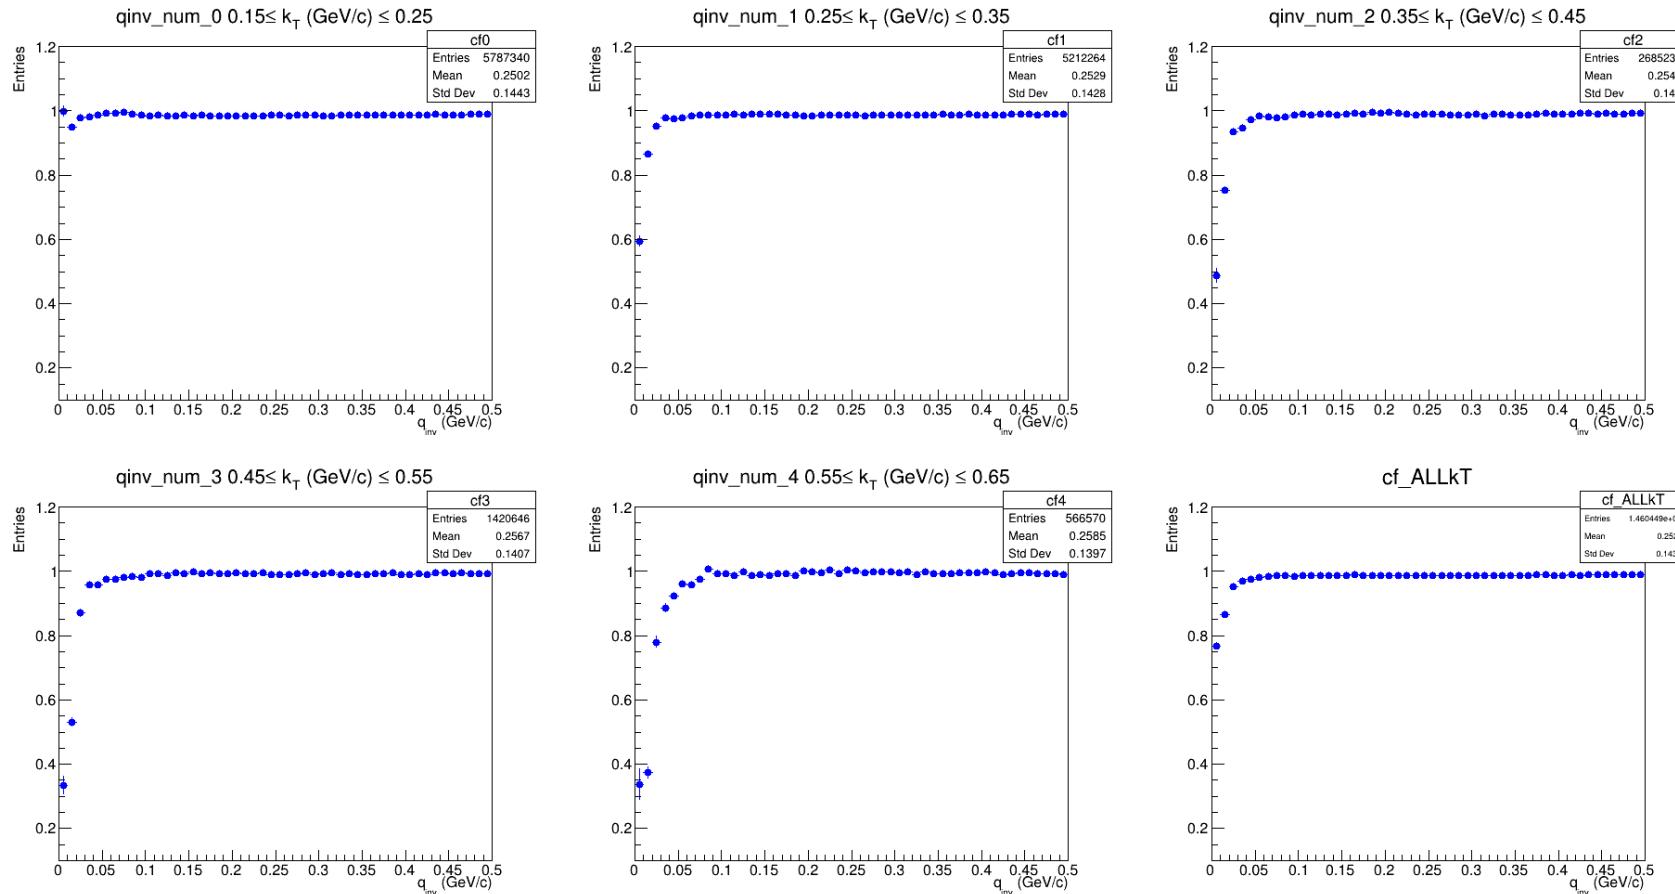

trackCut->setHbtPid( MpFemtoBasicTrackCut::HbtPID::Pion );

trackCut->setMass(M_PION_PLUS); // from MpFemtoMaker/phys_constants.h
```

CF with standard cuts

CF with standard cuts&&25<Nhits<65

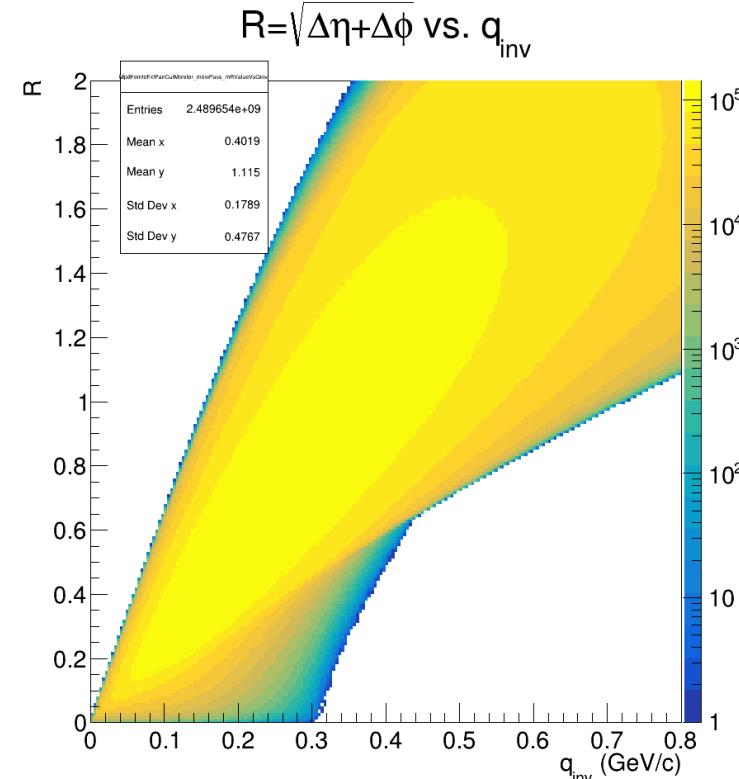

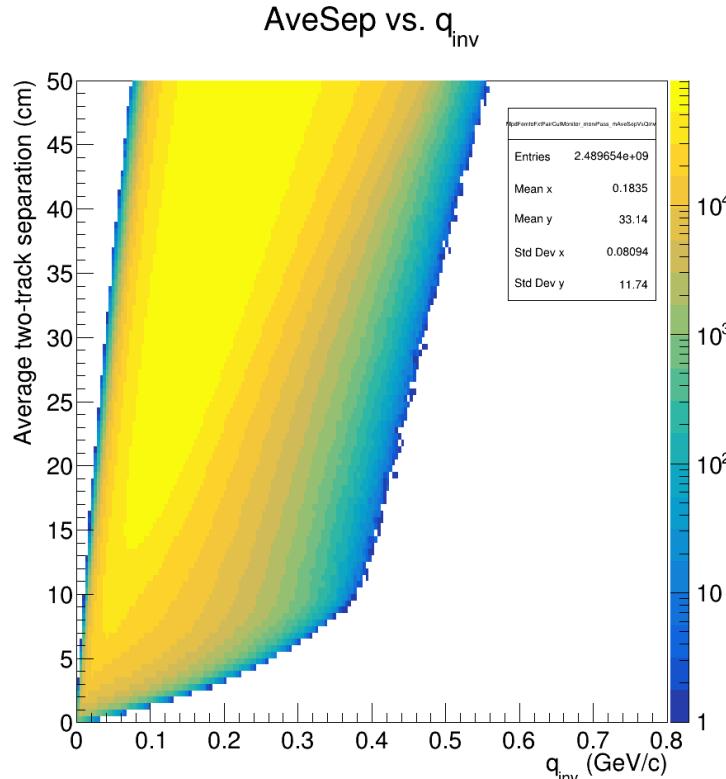

The gap at low qinv becomes greater than 15<Nhits<65

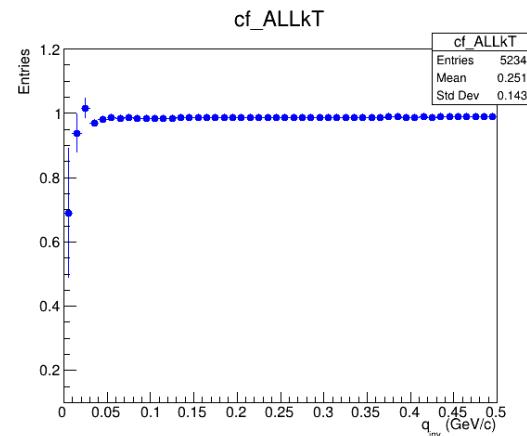

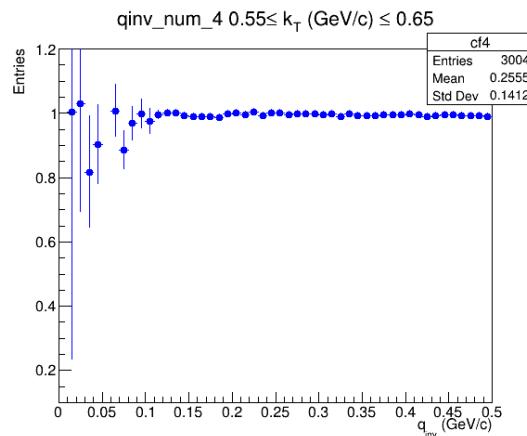

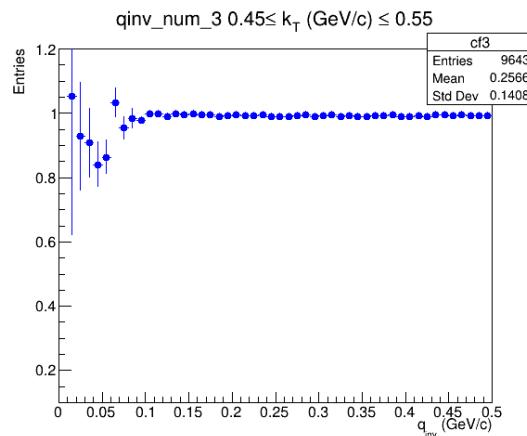

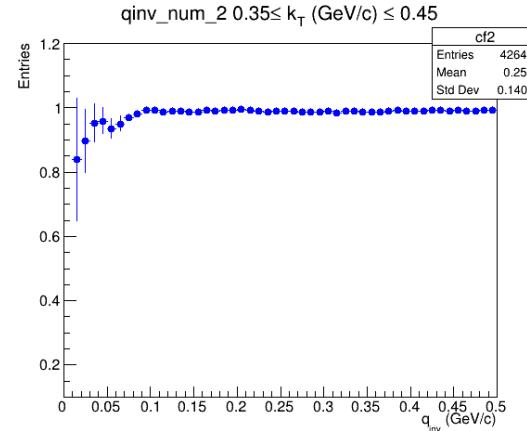

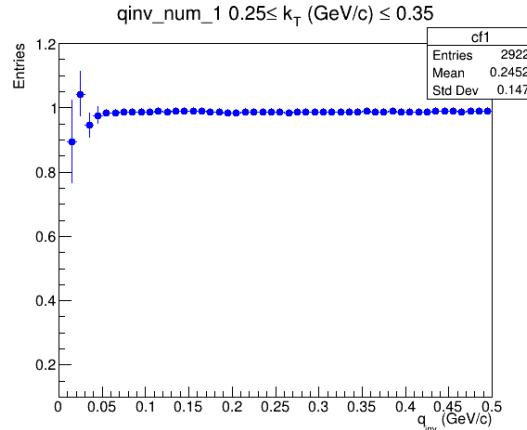

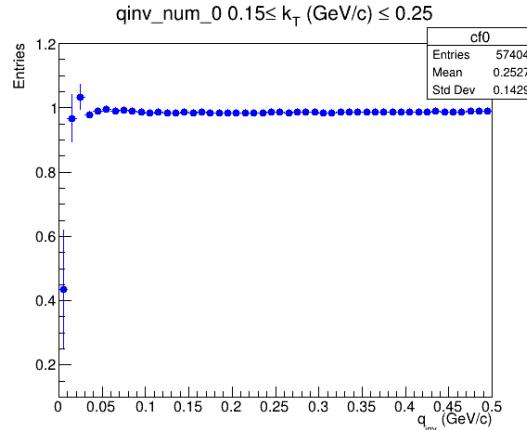

hbtMiniDst.C additional cuts

```
pairCut->setAverageSeparation(5,1e6); // Set cut on average separation between tracks in TPC (min, max)
```

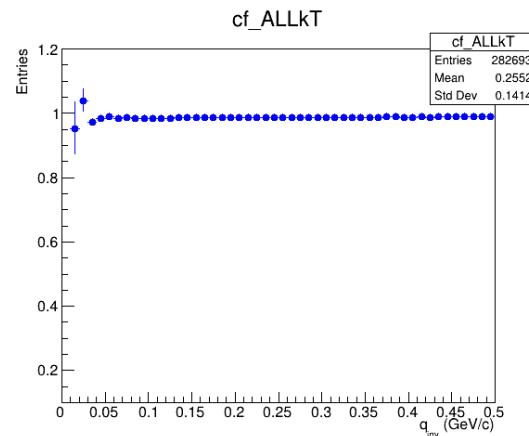

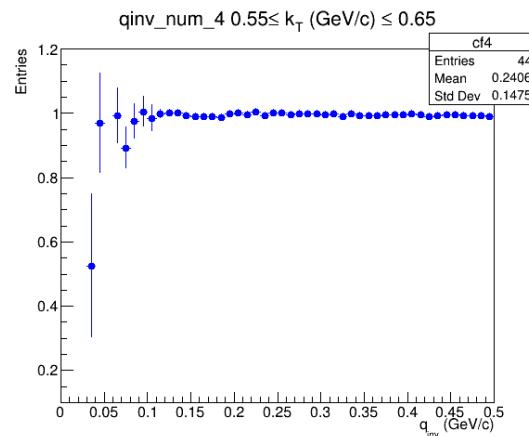

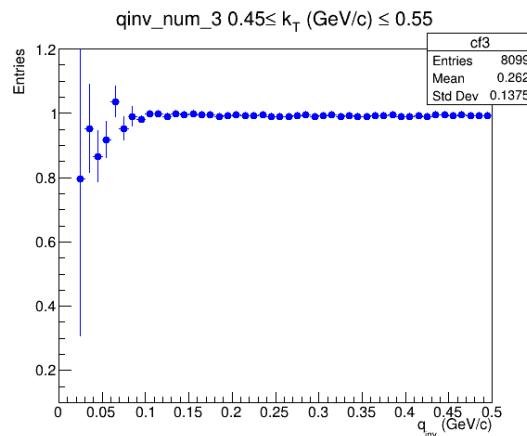

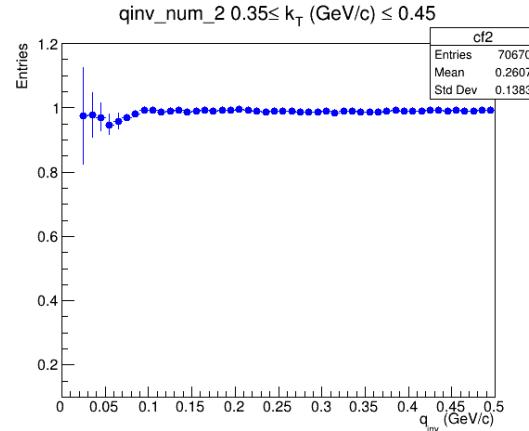

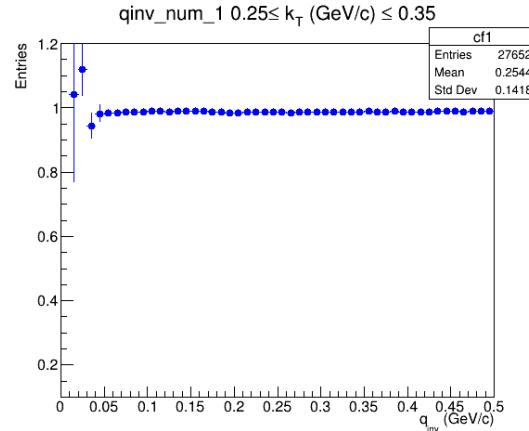

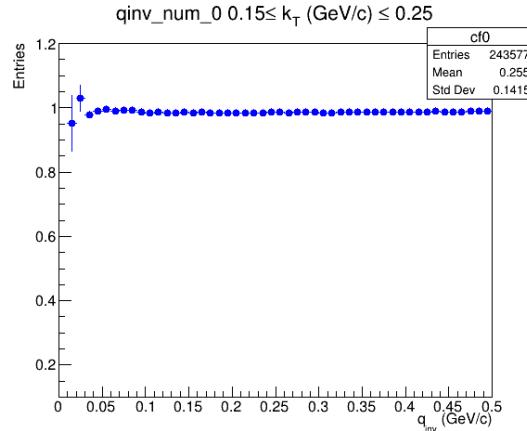

```
pairCut->setRValue(0.05); // Set cut on R=sqrt( dEta^2 + dPhi^2 ) (low)
```

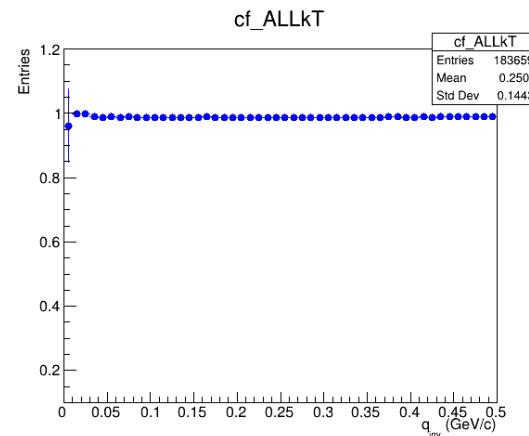

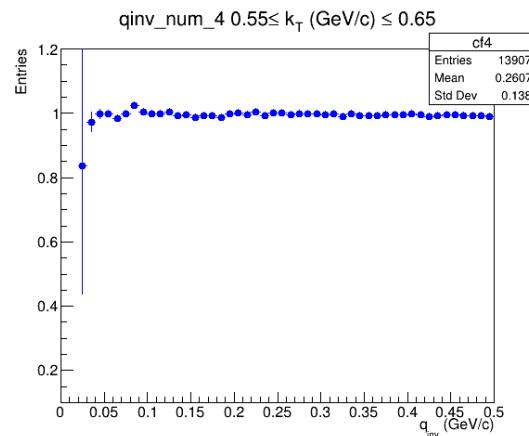

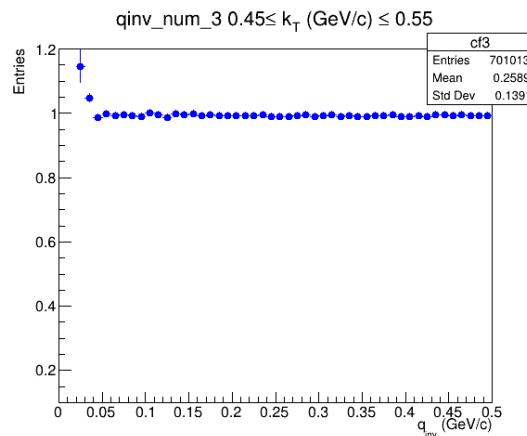

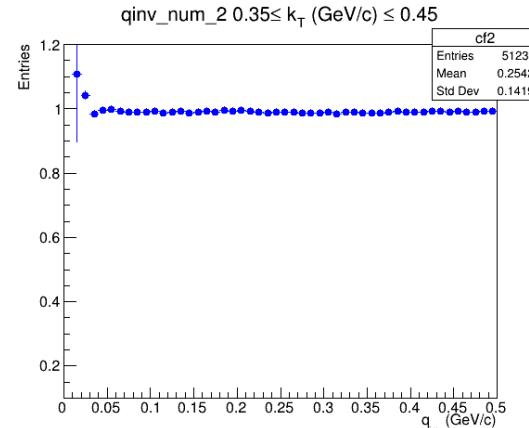

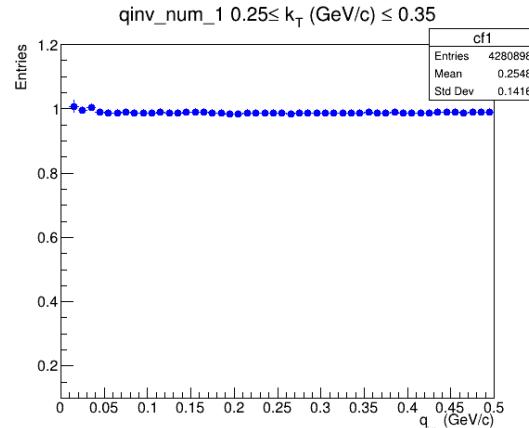

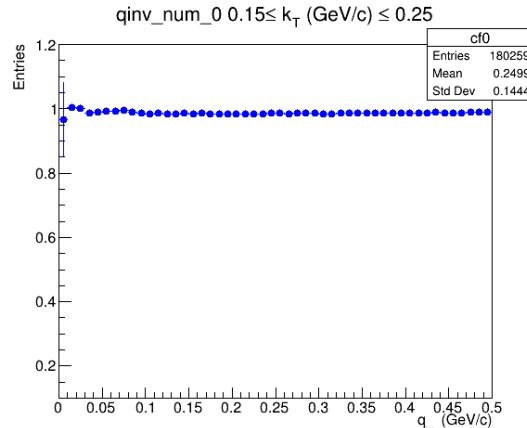

CF, $\sqrt{\Delta\eta^2 + \Delta\phi^2} > 0.2$ (cut1)

CF, AveSep>5 && $\sqrt{\Delta\eta^2 + \Delta\phi^2} > 0.2$ (cut2)

CF, AveSep>5 && $\sqrt{\Delta\eta^2 + \Delta\phi^2} > 0.05$ (cut3)

Conclusions

- There is a significant splitting in CF with standard cuts
- The splitting effect increases with increasing Nhits cut
- Two additional cuts:
 - Average separation between two tracks
 - Angular distance $\sqrt{\Delta\eta^2 + \Delta\phi^2}$
- These two cuts did a good job with:

$$\text{AveSep} > 5 \text{ \&\& } \sqrt{\Delta\eta^2 + \Delta\phi^2} > 0.05$$
